

Frame Search and Re-search: How Sociological Articles Change During Peer Review

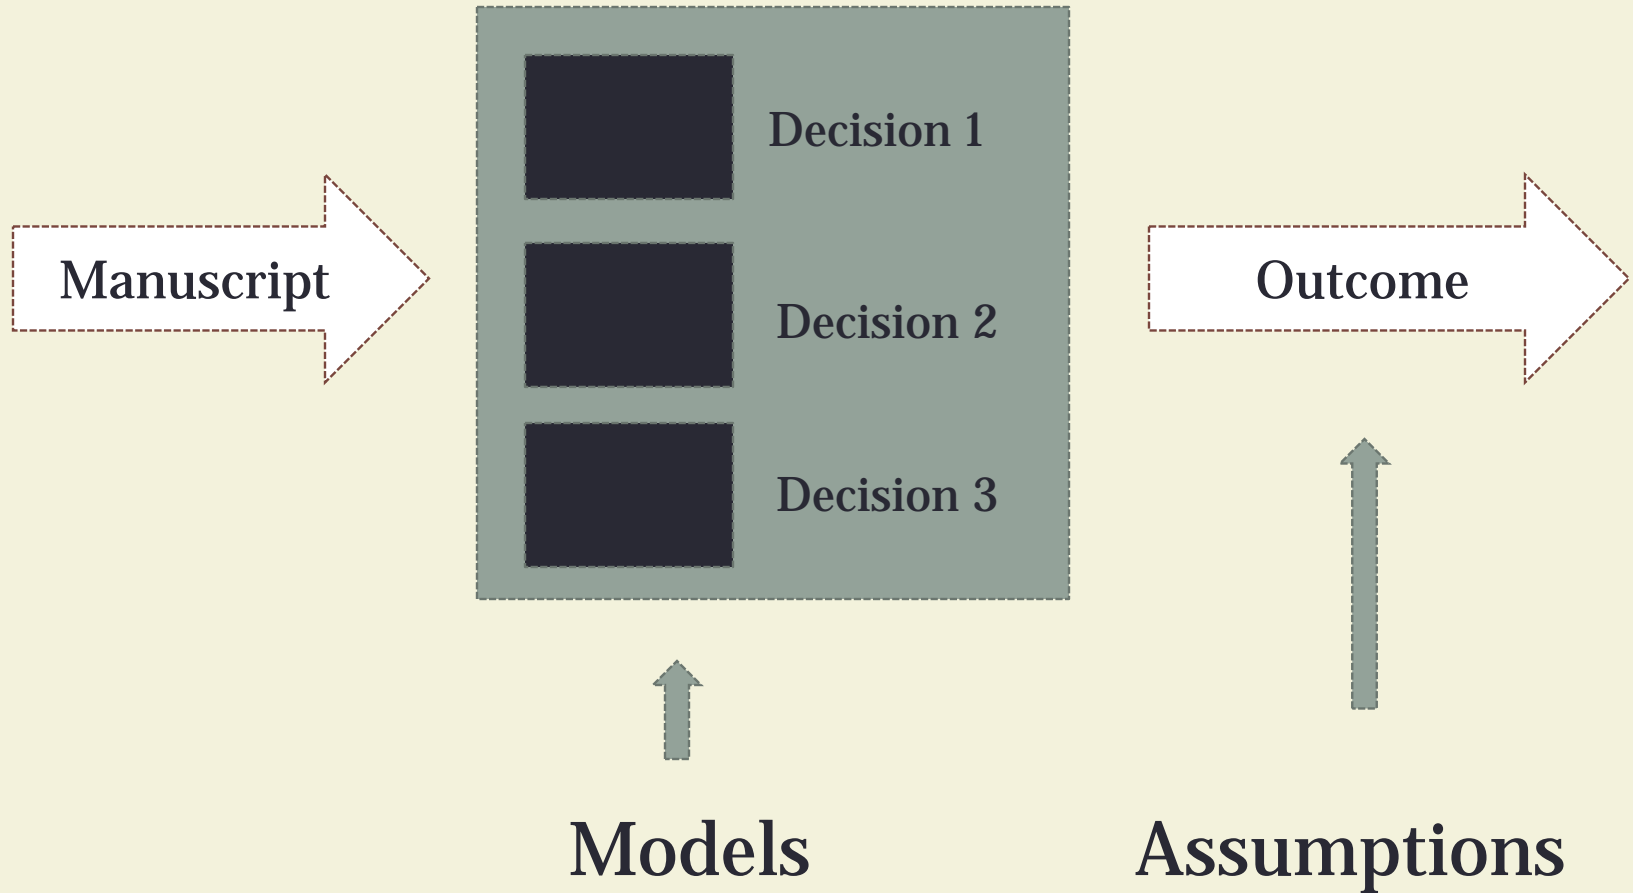

Do Peer Reviews Predict Impact?: Evidence from the
American Sociological Review, 1978-1982
(with Von Bakanic, College of Charleston)

PEERE CONFERENCE, LISBON, 2015

The gray box of peer review

Research on Peer Review

- **Is peer review fair?**
- **Is peer review reliable?**
- **Is peer review valid?**
- **Often data = grants**

A Different Angle – Constructive Angle

- **What about revise and resubmit?**
- First round of reviews at *ASR* :

	<i>ASR</i> ^a Referees		<i>ASR</i> ^a Editor
Both recommend acceptance	10%	Immediate acceptance	11%
Split	33	Revise and resubmit	24
Both recommend rejection	<u>57</u>	Immediate rejection	<u>65</u>
<i>N</i>	100% (342)		100% (342)

From Lowell Hargens 1988, p. 145.

- **How “quality” is *created***

Research Question, Significance

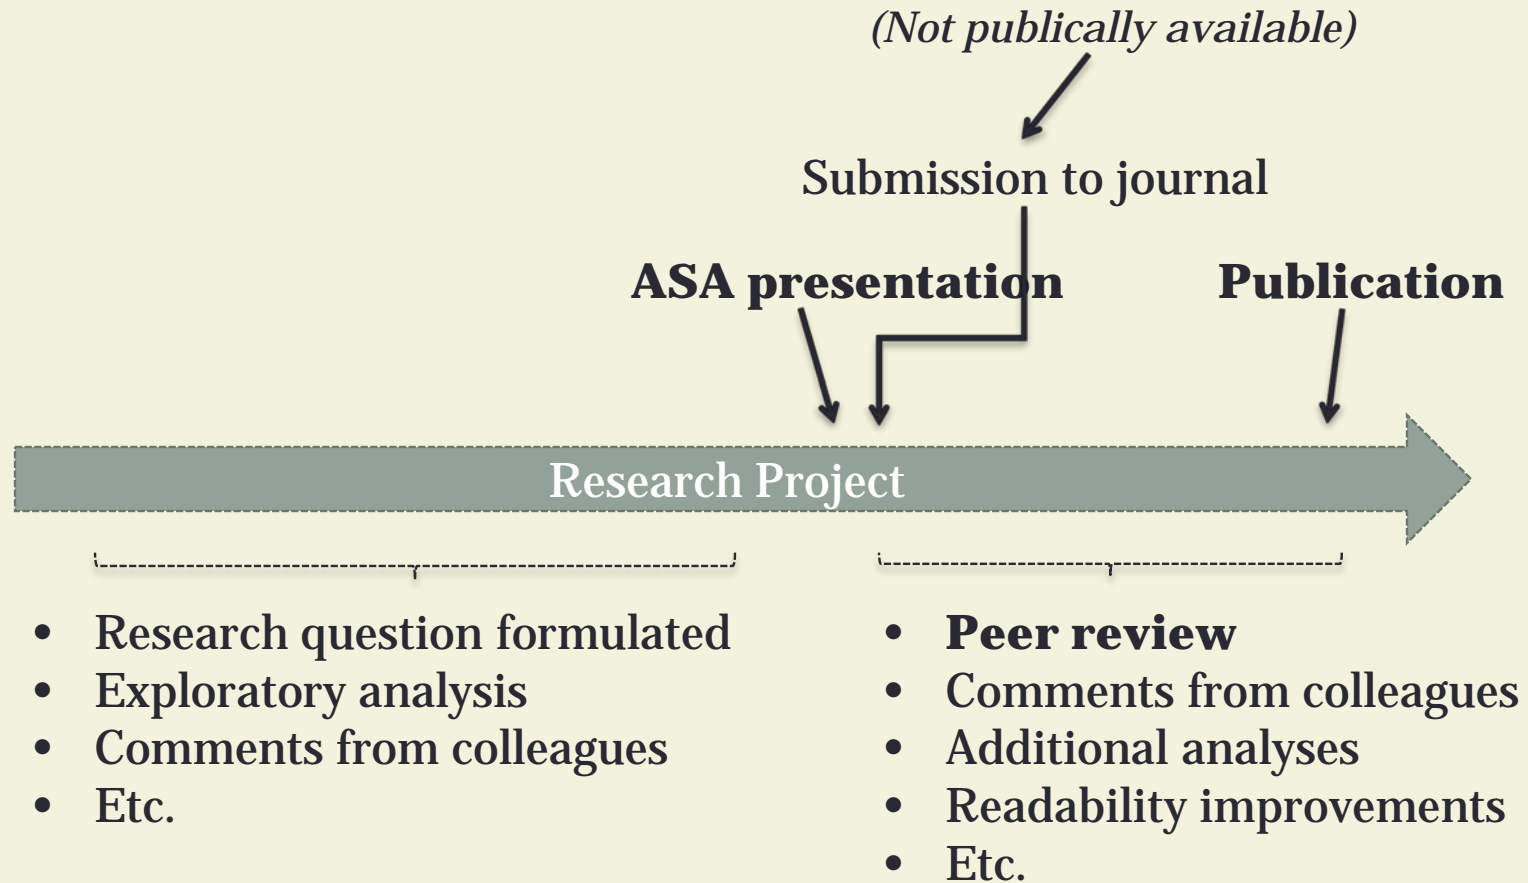

- **Question:** When reviewers find that the fit between theoretical framing and data analysis is inappropriate, what does the author change?

Different changes = different modes of peer review

- “Question-centered mode”
 - ✦ Research question is central.
 - “Data-driven mode”
 - ✦ Data analysis is central.
-
- **Significance:**
 - **Self-understanding**
 - Is R/R useful
 - What should we instruct reviewers to do? ← little work on this

Empirical Approach: Typical Trajectory

Empirical Approach: Approximation

(Often publically available!)

**ASA presentation paper =
Submission to journal**

(Always available)

Published paper

ETC.

Data: Articles from *ASR* and *SF*

1. Find articles that mention “american sociological association annual meeting”
 - 15 articles from *American Sociological Review*
 - 15 articles from *Social Forces*
2. Match to previous versions in ASA online database
 - Did not use all search results.
 - Article not quantitative
 - Article not uploaded to ASA database
 - 40% of *ASR*, 65% of *Social Forces* search results suitable

Methods: Measuring Change

- **Qualitative**

- **Read a sample of article pairs line-by-line and noted all changes**

- **Quantitative**

- **Text similarity between ASA and published, section-by-section**
 - ✦ Calculated computationally
- **Changes in theoretical framing**
 - ✦ Changes in *references* used in lit review/theory sections
- **Data analysis**
 - ✦ Changes in *variables* used in data analysis

Results: Qualitative

Data sources: Rarely change

Article pair 1

- Theoretical framing expanded, data analysis similar
 - **ASA paper**
 - ✦ Is diversity good for business?
 - ✦ Theoretical framing: diversity, racial diversity
 - **Published paper**
 - ✦ Is diversity good for business?
 - ✦ Theoretical framing: diversity, racial diversity, gender diversity
 - ✦ Data analysis: gender variable added

Article pair 2

- Theoretical framing different, data analysis similar
 - **ASA paper**
 - ✦ What determines how much people volunteer?
 - ✦ Hypothesis: “**female leaders will volunteer fewer hours** per week than their male counterparts”
 - **Published paper**
 - ✦ What determines how much people volunteer?
 - ✦ Hypothesis: *The gender of the leader will have a direct impact on weekly leadership effort such **that female presidents will devote more time** each week to the organization than male presidents”*

Results: Qualitative, cont'd

Article pair 3

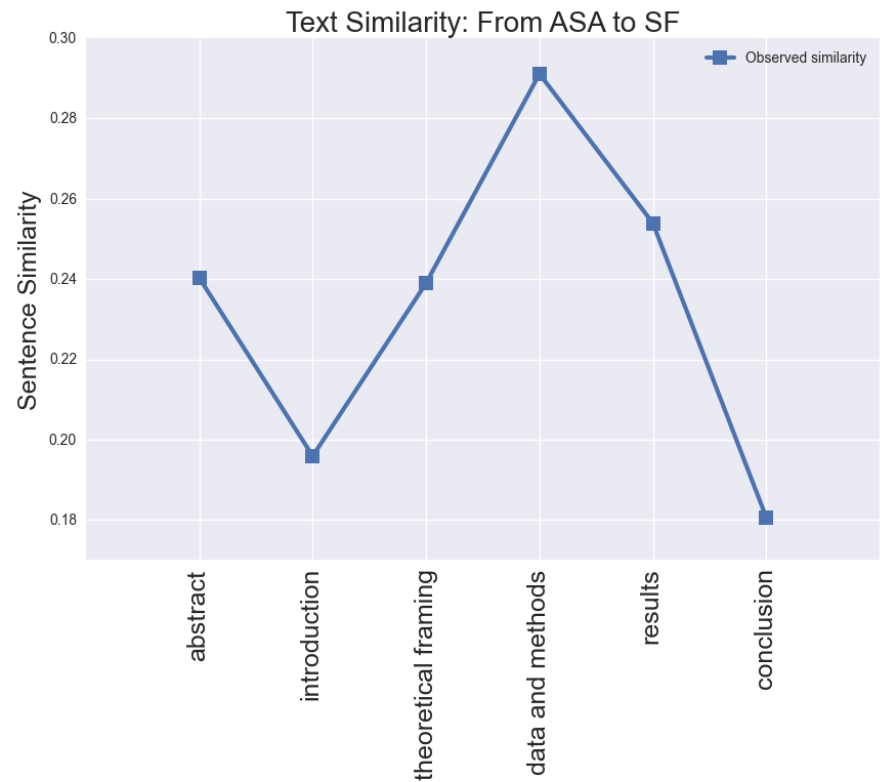

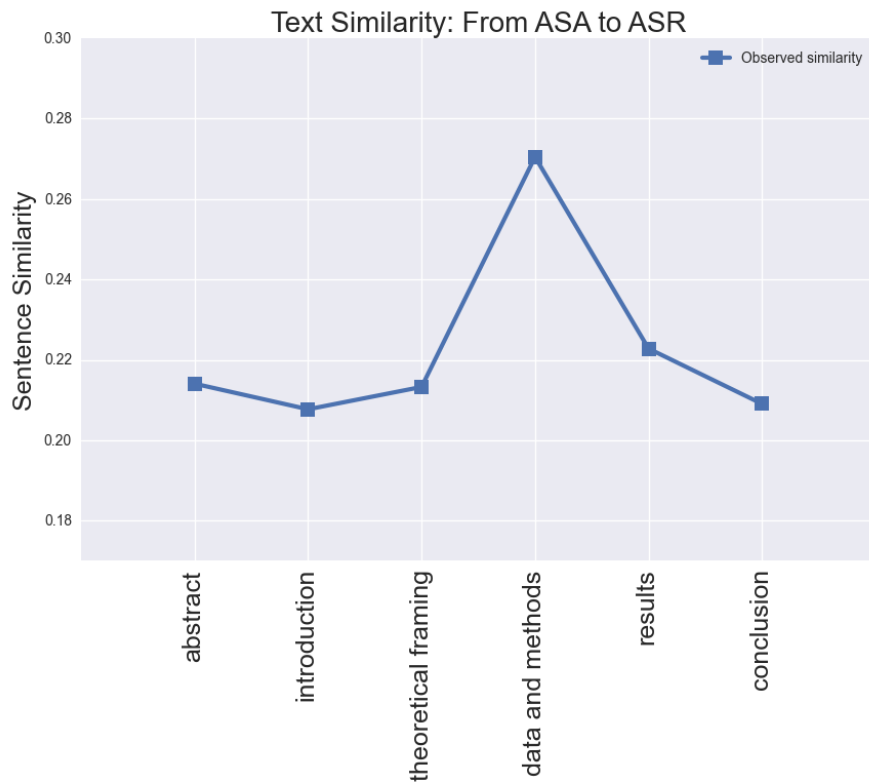

- Theoretical framing different, data analysis expanded
 - **ASA paper**
 - ✦ Cultural vs political factors → amount of pollution
 - ✦ “Races” 3 theories: modernization, political economy, institutional theory
 - **Published paper**
 - ✦ Cultural vs political factors → amount of pollution
 - ✦ “Races” 2 theories: political economy, institutional
 - ✦ Data analysis: adds an important interaction effect

Results: Text Similarity

y-axis: similarity of text between ASA and published version
(higher number, better average sentence match)

x-axis: section

Results: Similarity of Theoretical Framing

References in lit. review and theory sections:

	ASA version	Published version
Mean	34.4	40.5
Min	0	20
Max	73	85
Std	21.9	18.0

The percent of “old” references used in the “new” version of a paper is **31%** (sd = 0.21)

Results: Similarity of Data Analysis

Variables used in data analysis:

	ASA version	Published version
Mean	23.3	25.5
Min	0	12
Max	77	88
Std	15.7	16.2

The percent of “old” variables used in the “new” version of a paper is:
58.9% (sd = 0.25).

Conclusion: Which Mode of Peer Review?

- **“Question:** *When reviewers find that the fit between theoretical framing and data analysis is inappropriate, what does the author change?”*
- **Answer:** Theoretical framing

Implications: *is R/R useful?*

- **Now: second project.**
- **(Note to self: take a breath.)**

Do Peer Reviews Predict Impact?: Evidence from the *American Sociological Review*, 1978-1982

- **With Von Bakanic, College of Charleston**

Research question: Do peer reviews predict short- and/or long-term citations?

Motivation

- What can reviewers realistically evaluate/predict?
 - Impact?
 - Truth?
 - Originality?
 - Conflict of interests?

Quality vs. recognition of quality

1. Plausible: Quality = a little bit old + a little bit new
2. Recognition of quality: innovation is disruptive?
 1. E.g. Strength of Weak Ties

The data

- ASR 1978-1982
- Dataset #1
 - 755 manuscripts
 - 234 published (130 so far)
 - Includes reviewers' *decisions*
- Subset
 - 323 manuscripts
 - 52 published
 - Includes reviewers' decisions and *review texts*

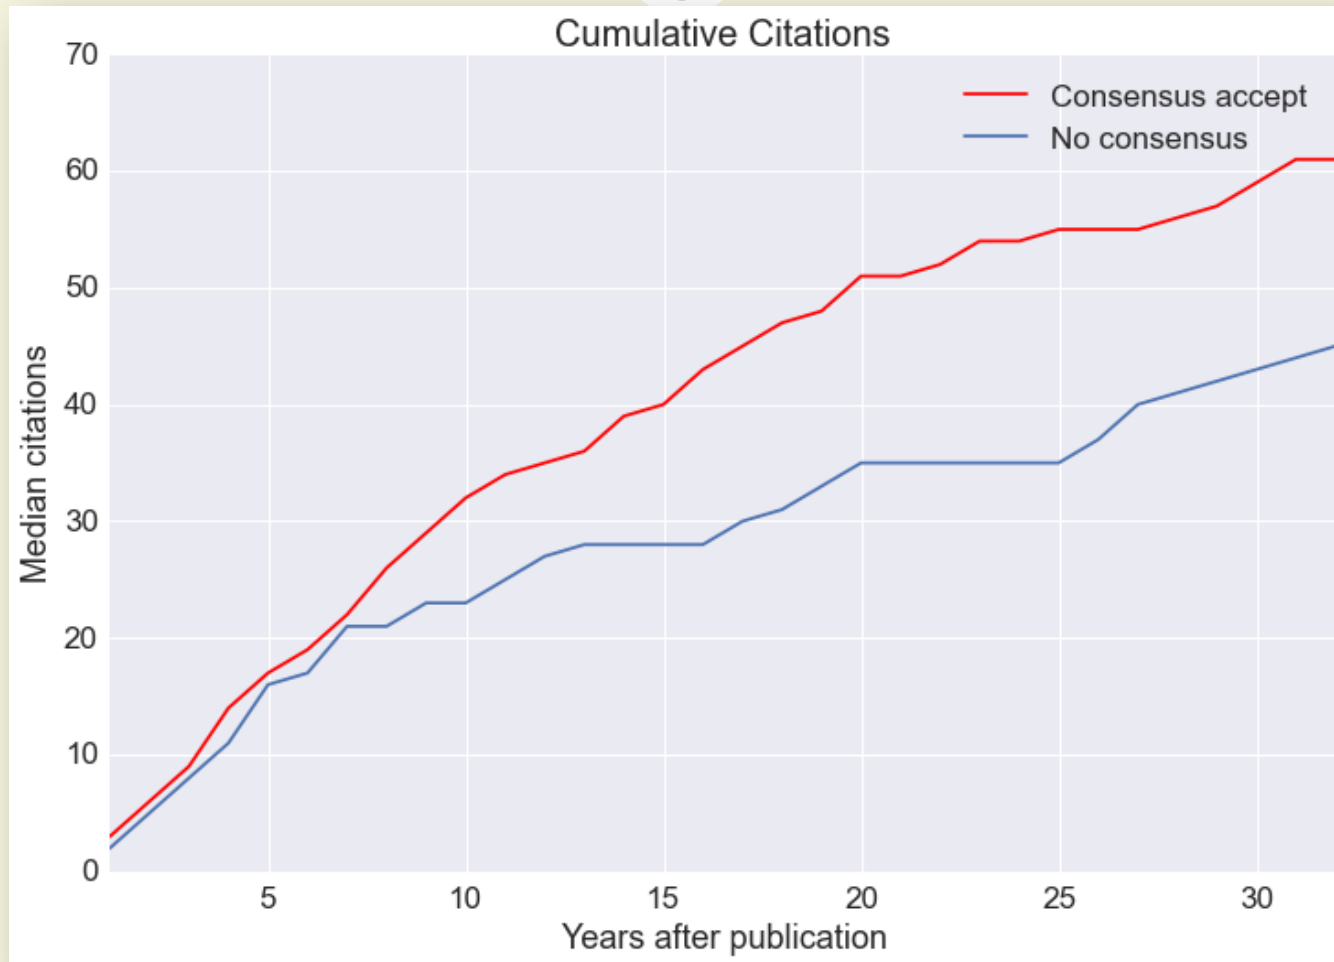

Articles by Peer Review Outcome

Citations (*median*) by Peer Review Outcome

Consensus vs No-consensus

What kind of model of individual choices is most likely?

- **Model 1: Idiosyncratic preferences**
 - Each reviewer judges on a different dimension
- **Model 2: “Representative”**
 - Each reviewer judges “as the community”

Intuition:

If model 1, some no-consensus articles should be high impact

0 = 1rd., consensus 1 = 1rd., no consensus

2 = 2+rds, consensus 3 = 2+ rounds, no consensus
