# WoS networks

Peer Review  
from WoS / 2

V. Batagelj,  
A. Ferligoj

Citations

Collaboration

References

From the **Web of Science** (WoS), using the queries "peer review\*" and refereeing, we downloaded in June 2015 the corresponding data set. We manually improved it.

Using the program WoS2Pajek we transformed it into a collection of networks: cite, **two-mode networks**: WA, WJ, WK; partitions DC (DC= a work w has (1) / has not (0) a WoS description), year (publication year); and CSV file titles with basic data about works with DC=1.

# Citation networks

Peer Review  
from WoS / 2

V. Batagelj,  
A. Ferligoj

Citations

Collaboration

References

A citation network is based on the citing relation  $C_i$

$$X C_i Y \equiv X \text{cites} Y$$

A citation network is usually (almost) acyclic. Using the 'preprint' transformation it can be transformed into a corresponding acyclic network in which we can determine the importance of arcs (citations) and nodes (works) using SPC (Search Path Count) weights.

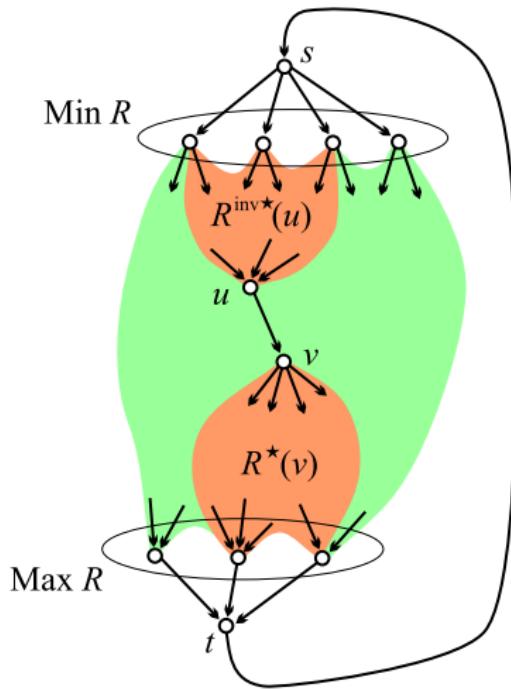

We first restricted the original citation network to its 'boundary' (21513 nodes). This network has one large weak component (8927 nodes), 66 small components, and 11783 isolated nodes. It contains also 7 small (4,4,3,3,2,2,2) strong components. We transform it into an acyclic network, CiteAcy, using the Preprint transformation. It has  $n = 21533$  nodes and  $m = 24031$  arcs.

# SPC – Search path count method

Peer Review  
from WoS / 2

V. Batagelj,  
A. Ferligoj

Citations  
Collaboration  
References

The **search path count** (SPC) method is based on counters  $n(u, v)$  that count the number of different paths from  $s$  to  $t$  through the arc  $(u, v)$ .

[arXiv](#), [Wiley book](#)

The **Main path** starts in a link with the largest SPC weight and expands in both directions following the adjacent link with the largest SPC weight.

The **CPM path** is determined using the Critical Path Method from Operations Research.

# Citation networks – SPC weights analysis

Peer Review  
from WoS / 2

V. Batagelj,  
A. Ferligoj

Citations

Collaboration

References

In the network we compute the SPC weights and on their basis determine the main path and link islands [20 200].

In July 2015 a new option was added to program Pajek: Network/Acyclic Network/Create (Sub)Network/Main Paths with several suboptions for computing local and global main paths and for searching for Key-Route main path in acyclic networks. For details see Liu, J.S. and Lu, L.Y.Y. (2012): An integrated approach for main path analysis: Development of the Hirsch index as an example. Journal of the American Society for Information Science and Technology, 63,528-542 ([paper](#)).

References

**Journals:** social science journals (sociological, psychological, educational,...).

The most **influential authors:** Cole and Cole (1967), Zuckerman and Merton (1971), Garfield (1972), Gottfredson (1978), and Peters and Ceci (1982).

**Topics:** scientific productivity, citation measures as measures of scientific accomplishment, scientific output and recognition, evaluation in science, referee system, journal evaluation, peer-evaluation system, review process, peer review practices.

# The main path publications from 1983 to 2002

Peer Review  
from WoS / 2

V. Batagelj,  
A. Ferligoj

Citations

Collaboration

References

**Journals:** biomedical journals, mainly in JAMA. From 1986 the International Congress on Peer Review and Biomedical Publication is organized every four years.

The most **influential authors:** Rennie (1986, 1992, 1993, 1994, 2002), Smith (1994, 1999), Jefferson (1995, 1998, 2002), and their collaborators.

**Topics:** the effects of blinding on review quality, research into peer review, guidelines for peer reviewing, monitoring the peer review performance, open peer review, bias in peer review system, measuring the quality of editorial peer review. Development of meta-analysis and systematic reviews approaches.

# The main path publications from 2003 on

Peer Review  
from WoS / 2

V. Batagelj,  
A. Ferligoj

Collaboration

References

**Journals:** specialized journals on science studies: Scientometrics, Research Evaluation, Journal of Informetrics, JASIST.

The most **influential authors:** Bornmann and Daniel (2005, 2006, 2007, 2008, 2009, 2010, 2011). The last paper on the main path is Waltman and Costas (2014).

**Topics:** Bornmann and Daniel studied the validity of committee peer review process for awarding long-term fellowship to post-graduate researchers, the use of h-index and pre-screening of applications at Boehringer Ingelheim Fonds. They also analysed citations of accepted and rejected papers at a prime chemistry journal (*Angewandte Chemie International Edition - AC-IE*), the effect of exchanging reviews, the peer review process in this journal, the validity of its editorial decisions. The last two papers (Bornmann and Leydesdorff, 2013; Waltman and Costas, 2014) use F1000 (a post-publication peer review system) recommendations as a source of research evaluation.

# Cuts, islands, cores

Peer Review  
from WoS / 2

V. Batagelj,  
A. Ferligoj

Citations

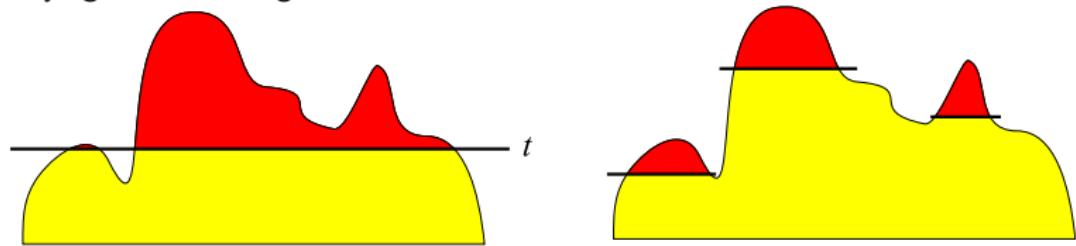

Collaboration

References

The **node-cut** of a network  $\mathcal{N} = (\mathcal{V}, \mathcal{L}, p)$ ,  $p : \mathcal{V} \rightarrow \mathbb{R}$ , at level  $t$  is a subnetwork  $\mathcal{N}(t) = (\mathcal{V}', \mathcal{L}(\mathcal{V}'), p)$ , determined by the set  $\mathcal{V}' = \{v \in \mathcal{V} : p(v) \geq t\}$  and  $\mathcal{L}(\mathcal{V}')$  is the set of links from  $\mathcal{L}$  that have both endnodes in  $\mathcal{V}'$ .

The **link-cut** of a network  $\mathcal{N} = (\mathcal{V}, \mathcal{L}, w)$ ,  $w : \mathcal{L} \rightarrow \mathbb{R}$ , at level  $t$  is a subnetwork  $\mathcal{N}(t) = (\mathcal{V}(\mathcal{L}'), \mathcal{L}', w)$ , determined by the set  $\mathcal{L}' = \{e \in \mathcal{L} : w(e) \geq t\}$  and  $\mathcal{V}(\mathcal{L}')$  is the set of all endnodes of the links from  $\mathcal{L}'$ .

If we represent a given or computed value of nodes / links as a height of nodes / links and we immerse the network into a water up to selected level we get **islands**. Varying the level we get different islands.

The subgraph  $\mathcal{H} = (C, \mathcal{E}|C)$  induced by the set  $C \subseteq \mathcal{V}$  is a ***p*-core at level**  $t \in \mathbb{R}$  iff  $\forall v \in C : t \leq p(v, C)$  and  $C$  is a maximal such set.

Ordinary **core**:  $p(v, C) = \deg_H(v)$

***p*s-core**:  $p(v, C) = \sum_{u \in C} w(v, u)$ ,  $w(v, u)$  is the weight of link  $(v, u)$
